Chinonye Emmanuel Onwuka

University of Benin - Department of Economics & Statistics, Nigeria

Abstract
This study empirically examined the relationship between poverty, income inequality and economic growth in Nigeria. The study used time series data from National Bureau of Statistics (NBS) and Central Bank of Nigeria (CBN) Statistical Bulletin between the periods from 1981 to 2019. The study employed the use of Augmented Dickey Fuller test, Co integration test and Error Correction technique. The unit root test results indicated that all the variables were stationary at first difference and co-integration test confirmed a long run relationship among the variables. The error correction model shows that about 96 percent of the discrepancy between the actual and the equilibrium value of economic growth is corrected or eliminated each year. The coefficient of determination (R²) is 0.68 which shows that about 68 percent variations in the economic growth were explained by the independent variables. Furthermore, the Breusch-Godfrey Serial Correlation LM Test shows that the probability of the chi-square (2) is 0.2775 and this is greater than 0.05 at 5% significance level.

This therefore confirms the absence of serial correlation. Also, the Breusch-Pagan-Godfrey Heteroscedasticity test indicates that the probability of chi-square (5) is 0.1242 and this is greater than 0.05 at 5% significant level. This also confirms the absence of heteroscedasticity in the model. From the study, the findings revealed that income inequality has a negative relationship with economic growth in the country while poverty was found to be positively related to economic growth. Similarly, the findings also revealed that poverty and income inequality has an insignificant effect on economic growth in Nigeria. Based on the findings, it can be concluded that poverty and income inequality has not significant relationship with economic growth in Nigeria. Thus, the study concludes that there is need for government of the country to come up with an all-inclusive policy and programme that will be targeted to the poor and give them ample opportunities to improve their welfare.

Keywords: Poverty, Income Inequality, Economic Growth, ECM, Nigeria. JEL classification code I32, D63, O10

Introduction
The foremost macroeconomic objective of governments in almost all countries of the world is the actualization of rapid economic growth [1]. The actualization of economic growth leads to higher and ever-increasing economic prosperity. This increasing economic prosperity is empirically linked to greater overall levels of societal progress and improvement. Conversely, without economic growth, economies of nations tend to stagnate thereby deficiency in the provision of the social and economic well-being of their citizens. Economic failure historically causes a loss of trust and social upheaval, frequent and ugly triggers of social conflicts [2].

Poverty is a global issue affecting both developed and developing economies of the world. Generally, it has a challenging effect on developing countries, the sub-Saharan Africa in particular [3]. Poverty is multidimensional in nature and can be evident in different forms such as deficiency of material income, adequate to guarantee good living standard; hunger and under-nutrition; illness; limited education and health services; persistent rise in mortality and morbidity due to sickness; homelessness and insufficient housing; insecure environments and social exclusion and discrimination [4].

Globally, statistics has shown that more than 800 million persons are still living on less than $1.25 a day [5]. Nigeria is endowed with rich human and natural resources. Given these wealth in economic

Poverty and Economic Growth

The relationship between poverty and economic growth has been investigated by various studies. Empirical evidences show that countries that have reduced poverty are the ones that have grown the fastest. Poverty, on the other hand, has grown fastest in coun-
tries that have stagnated economically. Page (2005) stated that it is difficult to argue that sustained poverty reduction can be achieved alongside economic stagnation or decline, the debate over pro-growth versus pro-poor strategies, hinges on the extent to which the average relationship between growth and income distribution conceals important variations that may, ultimately be addressed by public policy. Fosu (2010b) provides global evidence on how economic growth translated into poverty reduction among developing countries. He examined the impact of growth on poverty among Eastern Europe and Central Asia (EECA), South Asia (SAS), sub-Saharan Africa (SSA), Latin American Countries (LAC) and Middle East and North Africa (MENA) for the period 1981-2005. With the exception of EECA, he found that, poverty levels for all regions decreased for both the $1.25 and $2 a day poverty lines. He also found that with the exception of MENA, all regions exhibited greater poverty declines in the mid-1990s to 2005 sub-periods. Growth since the early 1990s has been substantial, mainly because of the various structural reforms implemented by most developing economies since the early 1980s. He explained further that while growth is a major factor behind changes in poverty levels, income inequality nevertheless is very important because of its effects on the poverty pattern in most countries. He therefore proposed that special attention should be paid to reducing income inequality particularly in countries with highly unfavorable income distribution. Ijaiya, Ijaiya, Bello and Ajayi (2011) examine the impact of economic growth on poverty reduction in Nigeria by taking into consideration a time subscript and a difference-in-difference estimator that describes poverty reduction as a function of changes in economic growth. Using a multiple regression analysis, the result obtained indicates that the initial level of economic growth is not prone to poverty reduction, while a positive change in economic growth is prone to poverty reduction. The study suggest that to improve and sustain the rate of economic growth in Nigeria from which poverty could be reduced measures, such as, stable macro-economic policies, huge investment in agriculture, infrastructural development and good governance are to be implemented.

Income Inequality and Economic Growth
Several studies have examined the relationship between income inequality and economic growth. Akpolih and Farayibi conducted a study on the magnitude of inequality as a barrier to economic growth in Nigeria between the periods 1981 to 2009 by employing the use of regression analysis [23]. Their results show that inequality decreases economic growth. They claimed that inequality leads to slower growth through the level of savings and total investment in the economy. Government inefficiency and corruption also had a role to play. Similarly, another study conducted by Awe and Rufus, found out that the Gini coefficient for Nigeria was very high, suggesting high levels of inequality [24]. This was primarily attributed to the level of GDP, education and government expenditure. Generally, studies such as Galor and Zeira (1993); Perotti (1993); Alesina and Rodrik (1994); Persson and Tabellini; Birdsall, Ross and Sabot; Clarke; Alesina and Perotti (1996); De la Croix and Doepke (2003); Josten (2003, 2004); Ahituv and Moav (2003); Viaene and Zilcha (2003); Castelló-Climent (2004); Knowles; Davis; Pedre, Florax and Partridge (2009) and Ncube, Anyanwu and Hausken (2013) has shown that there is a negative relationship between income inequality and economic growth [8,10,12, 21, 25]. On the contrary, studies such as Kaldor (1956); Partridge (1997); Li and Zou (1998); Forbes (2000); and Nahum are of the opinion that income inequality has a positive impact to economic growth [11]. According to Li and Zou (1998), income inequality may theoretically lead to higher economic growth if public consumption enters the utility function. However, according to a study conducted by Barro (2000), the effect of income inequality on economic growth may differ in developed and developing economies. Furthermore, studies such as Lee and Roemer (1998); Castelló and Domenech (2002); Panizza (2002); Kraay (2002) and Charles-Coll (2013) found no correlation or an inconclusive evidence of any correlation between income inequality and economic growth.

Aigbokhan (2008) found poverty elasticity of growth to be high in Nigeria. The author argued that economic growth in Nigeria propelled poverty, probably due to its non-inclusive nature. The empirical links between the variables were, however, not clearly specified in his models. Fosu (2009) showed that poverty reduction in sub-Saharan Africa had been less-efficient, due to the poor distributional mechanisms of income in the region. Furthermore, a study by Ncube, Anyanwu and Hausken (2013) also found that income inequality reduced economic growth and increased poverty in the Middle East and North African (MENA) region. From the divergences of methods applied in the literature and the results found, it was clear that a wide gap existed in the subject matter, particularly in Nigeria. Therefore, establishing both the theoretical and empirical relationship among economic growth, income distribution and poverty are necessary and critical for economic policy making.

**Methodology**

**Model Specification**

The specification of an appropriate econometric model borders on the prevailing economic circumstance(s) and the availability of economic data relating to the variable(s) being examined (Koutsosyiannis, 1997). Therefore, following the works of Hoi Quoc (2010) that stated that growth is a function of poverty and income inequality. This can be expressed mathematically as;

\[
RGDP = f (POV, INEQ) 
\]

However, equation (2) above can be modified as;

\[
RGDP = F (POV, INEQ, POP, UNEMP, GCE) 
\]

The econometric form of the model above is stated as;

\[
RGDP_t = \beta_0 + \beta_1 POV_t + \beta_2 INEQ_t + \beta_3 POP_t + \beta_4 UNEMP_t + \beta_5 GCE_t + \epsilon_t 
\]
Where; RGDP= Real Gross Domestic Product (GDP at constant prices)
POV = Poverty
INEQ = Income Inequality (proxy by Gini coefficient)
POP = Population
UNEM = Unemployment rate
GCE = Government Capital Expenditure
Ut = stochastic error term
β0 = constant term
β1 to β5 = coefficients of the variables
A Priori Expectation; β1 <0, β2 <0, β3 <0, β4 <0, β5 >0

Data and Sources
The study employed the use of annual time series secondary data sourced from the National Bureau of Statistics (NBS) and Central Bank of Nigeria (CBN) statistical bulletin spanning between the periods 1981 to 2019.

Techniques of Analysis
The study adopts an Ordinary Least Square (OLS) as a statistical tool of analysis. In order to avoid difficulties that may arise while performing regression on time series data with clearly non-stationary series thus leading to spurious regression results, this study however adopted Augmented Dickey Fuller (ADF) test for our unit root in order to attain stationary. The study also employed the use of Johansen co-integration test so as to ascertain the long run relationship between variables employed for this study. Finally, Error Correction Model (ECM) technique is employed to correct any form of dis-equilibrium in the short run.

The table 1 shows the detail account of the summary statistics for the explained and explanatory variables respectively. The average economic growth as proxied by real GDP is about 36920.22 with standard deviation of 25139.63. In respect of poverty, the mean value is 45.66 with a standard deviation of 8.89. The analysis of inequality shows a mean value of 43.88 with the value of standard deviation of 5.31. Finally, the mean value of population, unemployment and government capital expenditure are 2.59, 3.25 and 485.81 respectively. Skewness is a measure of asymmetry of the distribution of the series around its mean. Furthermore, the skewness of a normal distribution is zero. Positive skewness implies that the distribution has a long right tail and negative skewness implies that the distribution has a long left tail. From the above table we observe that RGDP, POV, INEQ, POP, UNEMP and GCE all have positive skewness and as such they have long right tails. Similarly, kurtosis measures the peakedness or flatness of the distribution of the series. If the kurtosis is above three, the distribution is peaked or leptokurtic relative to the normal and if the kurtosis is less than three, the distribution is flat or platykurtic relative to normal. From table 1 above, it is observed that POV, INEQ and UNEMP are all below three therefore this suggest that these variables are platykurtic while RGDP, POP and GCE are above three therefore this suggest that the variable is leptokurtic. Finally, Jarque-Bera is a test statistic to test for normal distribution of the series. From the table 1 above, the Jarque-Bera for RGDP, POP and GCE are above three therefore this suggest that the variable is leptokurtic. The study also employed the use of Johansen co-integration test so as to ascertain the long run relationship between variables employed for this study. Finally, Error Correction Model (ECM) technique is employed to correct any form of dis-equilibrium in the short run.

Table 2 above shows a correlation matrix of variables under consideration. The findings show that there is a positive relationship between poverty and economic growth in Nigeria. Inequality was found to have a negative relationship with economic growth in Nigeria. Finally, population, unemployment rate and government capital expenditure were found to be positively related to economic growth.

Table 3 above shows the results of unit root test for Augmented Dickey Fuller Test. It shows that in the process of comparing the test statistic value against the Mackinnon critical value at 1%, 5% and 10% level of significance, it was noticed that D(POV), D(INEQ), D(POP), D(UNEMP) and D(GCE) were found to be stationary at first differenced. Hence, having tested for the stationarity of the variables, we proceed to test for the long run relationships of the variables which give us the co integration result in table 4 below;

Table 4 above depicts the results of Johansen Co integration test. It shows the estimated result of the long run relationship between the variables that is D(RGDP), D(POV), D(INEQ), D(POP), D(UNEMP) and D(GCEX) using the Johansen co integration test. It was observed that the trace statistic in table 4 indicated 6 co-integrating equations at the 5% level of significance. Similarly, the maximum Eigen value statistic also indicates 3 co-integrating equation at the 5% level of significance. These results suggest that there is co-integration or long–run relationship among the variables employed in this study. Thus, we further proceed to conduct an error correction test, given the one year time lag used to show the speed of adjustment of the dependent variable to the changes in the explanatory variables in the short run and the result is presented in table 5 below;

Source: Authors’ Computations using Eviews 10.0, 2021.

Table 5 above depicts that the output of a parsimonious error correction model (ECM). It shows that about 96.7 percent of the discrepancy between the actual and the long run or equilibrium value of real gross domestic product is corrected or eliminated each year. Notice that the coefficient of the ECM has a negative sign as expected and is significant at 1% probability level. Thus, this validates our earlier position that the variables under study are indeed co-integrated. The coefficient of determination (R2) is 0.68 which shows that about 68 percent variations in the real gross domestic product were explained by the independent variables. The coefficient of poverty is 46.97 and it shows that a unit increase in the D(POV) will result to about 46.97 increase in the D(RGDP). The coefficient of income inequality is -433.52 and it shows that a unit increase in the D(INEQ) will result to about 433.52 decrease in the D(RGDP). The coefficient of population is 14196.19 and it shows that a unit increase in the D(POP) will result to about 14196.19 decrease in the D(RGDP). The coefficient of unemployment rate is 312.23 and it shows that a unit increase in D(UNEMP) will result to about 312.23-unit increase in real GDP. Finally, the coefficient of government capital expenditure is 15.13 and it shows that a unit increase in D(GCE) will result to about 15.13-unit increase in real GDP. Similarly, the t-test for the intercept, D(RGDP), D(POV), D(INEQ), D(POP), D(UNEMP) and D(GCE) were 0.71, -1.105, 0.178, 0.456, 6.231 respectively. By implication, the t-test indicates that poverty rate and inequality has no significantly effect on economic growth in Nigeria at 5 percent level of significance. Similarly, the F-test is 6.688 shows that the overall test is significant. Thus this tells us that the explanatory variables are simultaneously significant in forecasting economic growth in Nigeria. Also, the Durbin-Watson statistics value of 1.992 indicates that there is no autocorrelation in the model.
Post-Diagnostic Test Confirmation of the absence of Serial Correlation

H0: The residuals are not serially correlated
H1: The residuals are serially correlated

Decision Rule
Probabilities > 0.05 accept the null hypothesis
Probabilities < 0.05 reject the null hypothesis

The above table 6 present the result of Breusch-Godfrey Serial Correlation LM Test. Based on the findings, the probability of the chi-square (2) is 0.2775 and this is greater than 0.05 at 5% significance level and therefore the null hypothesis is accepted. This implies and therefore confirms the absence of serial correlation.

Confirmation of Absence of Heteroscedasticity

Table 7: Breusch-Pagan-Godfrey Heteroscedasticity Test

H0: Homoscedasticity
H1: Heteroscedasticity

Decision Rule
Probabilities > 0.05 accept the null hypothesis
Probabilities < 0.05 reject the null hypothesis

The above table 7 present the Breusch-pagan-Godfrey Heteroscedasticity test, the probability of chi-square (5) is 0.1242 and this is greater than 0.05 at 5% significant level and therefore the null hypothesis is accepted. This implies and therefore confirms the absence of heteroscedasticity in the model. In essence, they have constant variance in repeated sampling.

Parameter Stability Test (CUSUM Test)

Hypotheses
There are two hypotheses governing the CUSUM and they are expressed below.
H0: parameters are stable
H1: parameters are not stable.

Decision Rule
If the blue/dotted line is found between/within the two parallel red lines, we accept the null hypothesis (stable) and reject the alternative hypothesis (not stable). But if the blue line is found across/outside the red lines, we accept the alternative hypothesis (not stable) and reject the null hypothesis (stable).

From the figure 1 above, the CUSUM remained within the 5 percent critical lines throughout the whole period thus, signifying parameter stability during the course of assessment.

Conclusion
This study empirically examined the relationship between poverty, income inequality and economic growth in Nigeria using data spanning between the periods 1981 to 2019, by employing the use of Augmented Dickey Fuller test, Co integration test and Error Correction technique. From the study, the findings revealed that income inequality has a negative relationship with economic growth in the country while poverty was found to be positively related to economic growth. Similarly, the findings also revealed that poverty and income inequality has an insignificant effect on economic growth in Nigeria. Based on the findings, it can be concluded that poverty and income inequality has not significant relationship with economic growth in Nigeria. Thus, the study concludes that there is need for government of the country to come up with an all-inclusive policy and programme that will be targeted at the poor and
give them ample opportunities to improve their welfare. Since, most income inequality in the country tends to be obvious and visible in the rural area and places with low social and economic welfare, it therefore means that there is need for the government to provide basic infrastructure such as good road, schools, health care facilities, availability of good water supply and electricity to people in those places. If properly done, will ultimately result to decline in poverty and income inequality in the country.
